

Acme Incident Response Guide

Internal training fixture - revision September 2026

Purpose	Safe, fictional content for local RAG demonstrations
Topics	Severity model, Roles, Containment and recovery, Learning review
Data class	Synthetic / non-confidential

1. Severity model

SEV-1 incidents involve broad unavailability, confirmed sensitive-data exposure, or critical safety impact. SEV-2 incidents cause substantial degradation with a viable workaround. The on-call engineer declares severity and may revise it as evidence changes.

2. Roles

The incident commander owns coordination and decisions. The operations lead investigates and mitigates. The communications lead publishes internal updates every thirty minutes during a SEV-1. A scribe maintains the timeline, decisions, and evidence links.

3. Containment and recovery

Responders first protect people and data, then stabilize the service. Credentials suspected of compromise are rotated immediately. Recovery changes use the emergency deployment process and must preserve logs needed for investigation.

4. Learning review

A blameless review is scheduled within five business days. It records customer impact, contributing conditions, detection gaps, and owned corrective actions. Action owners provide status updates until verification is complete.
